

React Native Front-End Interview Exam

Discover Feed Screen: Build and Animate

Part 1: Candidate Brief

Rebuild the "Discover" feed screen from the Figma file 1:1 in React Native (Expo is fine), then bring it to life with animation.

Figma: <https://www.figma.com/design/FqHthl6SKqN395WuD3ze9y/Miracle-Test?node-id=0-1>

Required

- Pixel-accurate layout against the Figma: spacing, typography, radii, colors, the gradient/cloud header, and the verified badges.
- The full screen: portfolio header with Deposit button, the "Top trades last 24h" horizontal carousel, the tab row (Discover / Following / Rising / Favourites), and a scrolling feed of trade cards.
- Each feed card shows the avatar, the Buy tag, stats, the asset row with price and % change, the sparkline with entry markers, and the expandable "Read more" note.
- A floating bottom nav bar with 5 items, a mascot in the center, and an active-state pill.
- Runs on both iOS and Android without layout breakage (safe areas, different screen sizes).

Creative requirement

- Animate the nav bar. Tab switching, the active pill, the mascot and press feedback are all open to interpretation. Surprise us.
- Add any other motion you think the screen deserves (sparkline draw-in, number count-up, card entrance, tab underline, scroll-linked effects). Restraint counts too, so don't animate everything.

Constraints

- Animations must run on the UI thread (Reanimated worklets or equivalent) and stay at a smooth 60fps while scrolling.
- Use mock data. No backend is needed.
- No time limit. Submit a repo with a README that covers your decisions, trade-offs and what you'd do next.

Submission

GitHub repo, plus a short screen recording on a real device if possible.

Part 2: Grading Rubric (Interviewer Only)

Suggested weights:

Area	Weight	What to look for
Fidelity to Figma	20%	Spacing, type scale, colors, shadows, blur and gradient handled well
Animation quality and creativity	25%	Nav bar has a clear idea behind it, easing and spring choices feel right, nothing is gimmicky
Performance	20%	FlatList/FlashList with memoized renderItem, animations off the JS thread, no unnecessary re-renders, sparklines done with SVG or Skia rather than images
Code structure	15%	Component breakdown, design tokens/theme, typed props, reusable pieces
Robustness	10%	Safe areas, small and large devices, dynamic text, Android blur fallback
Communication	10%	README quality, honest trade-offs
